Authorized Summary

Project P75 2.0

Dark field microscopy/live blood analysis

“Quantum Upgrade”

The dark field microscopy carried out by IFVBESA on the physical effectiveness of the test object, the "Quantum Upgrade", has clearly shown that this test object is capable of significantly harmonizing biologically significant stress factors in the living blood of the test subjects. This is also confirmed by the BESA tests carried out in parallel (see also project P75 2.1). Using dark field microscopy, the effect of the stress factors on the test persons and their living blood as well as their biological control circuits was questioned and tested on the physical level. The BEFORE - AFTER dark field microscope comparisons of the live blood show significant changes. The images of the dark field microscope confirm the stress produced by the tested factors and, more importantly, how the living blood changes into more vital or body-immanent and biocompatible visible values after application of the "Quantum Upgrade".

From a holistic point of view, it can be assumed that the positive effect on the test subjects also occurs with other test subjects. The positive influence of the "Quantum Upgrade" is indeed possible with high precision is clearly shown by this project with its BEFORE-AFTER comparisons on the various test subjects. For the most part, the images of the dark field microscopy show significantly improved blood properties. A bodily regulation dynamic has taken place. In the sense of IFVBESA, one can clearly speak of a significant change in the body's own blood in the direction of vitality.

Result

All subjects showed a deregulated blood situation or a stressful condition in the BEFORE blood tests. Some subjects showed blood parameters that deviated strongly from the norm in some cases, which could be illustrated very nicely via the microphotographs of the blood.

If one compares the blood pictures of test persons who have received medications versus those who live largely in a natural way, their higher burden in the blood is only partially detectable. The medical history shows that stress, electromagnetic interference fields (EMSF), environmental pollution, denatured nutrition or certain stressful living conditions also have an influence on the blood and the salutogenesis of the test persons.

In the AFTER microscopy, the subjects were quantum entangled over a distance of about 8 km (as a crow flies) with the test object. In contrast to the BEFORE microscopy, in which the "Quantum Upgrade" was not used, significant changes in the blood were found throughout, which indicate that a vitalization of the blood had taken place. The bodily regulation dynamics visibly developed into a regulatory range of action.

In this project as a "quantum-entangled double-blind study", proof of the effectiveness of the test object, the "Quantum Upgrade" was provided to the tested subjects. Thus, the requirements for the receipt of a BESA seal of approval by the International Professional Association for BESA were also confirmed via dark field microscopy.
